Study title
Compassionate Mind Training for adolescents and their parents.

Description
Pilot study including 10 adolescents and their parents.

Scales
Self-compassion measure, perceived stress and psychiatric symptoms.

Progress / Outcome
The main findings suggest that the adolescents with moderate to severe psychiatric symptoms show higher wellbeing, can ask for help from adults and are more involved in their school. The parents have decreased their stress symptoms and show positive effects regarding self-compassion.

Study title
An Existential Phenomenological Investigation Experience of Being Self-Compassionate During the Process of Recovering from Alcohol and/or Substance Abuse

Description
This study’s goal was to expand the scientific understanding of the lived experience of being self-compassionate during the process of recovery from substance abuse. In order to conduct this study, seven individuals were invited to share their written narratives of the phenomenon with the researcher. The written narratives were subsequently analysed using Giorgi’s phenomenological methodology.

Progress / Outcome
Five essential constituent themes emerged as a result of this study: (a) Being self-compassionate assists one to grow from one’s mistakes; (b) Accepting the humanness of one’s own emotions; (c) Being self-compassionate is a complex and on-going process; (d) Being mindful of the suffering innate in living; and (e) Avoiding suffering leads to increased self-criticism.

Study title
Construction and Validation of a Short Form of the Japanese version of the Self-Compassion Scale

Scales
The Japanese version of the 12-item Self-Compassion Scale; Beck Depression Inventory; Satisfaction with Life Scale.

Progress / Outcome
Confirmatory factor analyses, as well as internal consistency analyses revealed that a Japanese version of a 12-item Self-Compassion Scale–Short Form (SCS-J-SF) had the similar six-factor structure to the Japanese long form and reliability coefficients were satisfactory.

Study title
Growing Kind Minds: A feasibility study and preliminary trial of adapted group-based Compassion Focused Therapy for people with Intellectual Disabilities (CFT-ID)

Description
Pilot/feasibility study of a six session CFT group for folk with ID and co-occurring Mental Health issue (at least two groups to be run). Pre and post group measures of psychological distress and well-being, self-compassion, and social comparison. Session feasibility and acceptance measure developed and administered after every group session to help ascertain how understandable and helpful the material and experiential practices are. Focus group to be run on completion of the group to explore participants’ experiences of attending the group, further exploring acceptability and feasibility.

Scales
PTOS ID-II (Psychological Therapies Outcome Scale for Intellectual Disabilities–Second Edition); Self-Compassion Scale Short-Form (adapted for ID); Adapted Social Comparison Scale; CFT-ID Feasibility and Acceptability Measure

Progress / Outcome
Group protocol and material developed.

Study title
Psychometric properties of a scale for the measurement of social defeat perception in Chilean population: The Defeat Scale

Description
In the last decades Chile has obtained poor indicators of mental health. Likewise, in the social area, it appears like one of the countries with major social inequalities. That situation is negative evaluated by citizens, and as a consequence they have denounced collectively some situations links to inequalities. Even though, public policy declares that social determinants, such as inequality, affect individual and collective mental health, it is not entirely clear through what mechanism can trigger this association. The social defeat defined as a sense of failed struggle concerning the loss or disruption of some valued status or internal hierarchical aims, is a construct that may favor the understanding of this relations. The purpose of this study is to analyze the psychometrics properties of The Defeat Scale by Gilbert and Allan (1998) in a sample of college students. To the best of our knowledge, this scale has not been translated to Spanish, besides in Latin America only exists a Portuguese version of it. The sample will be around 600 students of the Universidad San Sebastián (Chile) and other institutions of the area. Firstly, it will be done the adaptation process using the translation-back translation methodology. Then a pilot assessment it will conducted for adjusted, if necessary, ending with the application to the selected sample. Data analyses include reliability and validity procedures, including confirmatory factor analysis (CFA). Also it will explore two criteria indexes of validity (discriminant validity with social wellbeing and convergent validity with hopelessness).
Progress / Outcome
Permission by original authors; project sent for ethical approval (in Chilean committee); Adjudication of funding for the project; Adapting process and psychometric analysis of the Social Well-being Scales (Keyes et al., 2002; Blanco y Díaz, 2005); First Spanish version and back translation to English.

Study title
The relationship among self-criticism, self-compassion, rumination response style, and depression.

Description
The Forms of Self-Criticising/Attacking & Self-Reassuring Scale (Validation). Sample: stage 1 – 202 undergraduate students; stage 2 (re-test, 3 weeks later) – 20 of 202 undergraduate students. Data analysis: Exploratory factor analysis, Confirmatory factor analysis, Cronbach’s alpha, Test-retest reliability.

Progress / Outcome
Translation progress: translation of English version to Chinese version; Back-translation (one student from Graduate Institute of Translation and Interpretation); discussion and modification of the scale with two English teachers in Language Centre of Chung Yuan Christian University.

The results indicated that: (1) the Forms of Self-Criticizing/Attacking and Self-Reassuring Scale-Chinese Version had good psychometric properties; (2) the hated self of self-criticism and depression had positive correlation; (3) self-compassion and depression had negative correlation; (4) brooding and depression had positive correlation; (5) the hated self of self-criticism and brooding had positive correlation; (6) self-compassion and brooding had negative correlation; and (7) the indirect effects of the mediation model were significant.

Study title
Attitudes Towards Mental Illness: Cross-cultural study of Caribbean region

Description
The aim of this research is to explore people’s attitudes towards mental health related problems. This study will focus on the perception of individuals who were born in the Caribbean and are currently living there. The objectives are: to understand how the general population perceive those who may have a mental illness.

Past studies: My research indicates that very few studies have been done regarding stigma and attitudes towards mental illness of persons who have been born and raised in the Caribbean region. Arthur et al (2010) reported that there is a high level of stigma attached to mental illness in Jamaica. They also suggested that without proper education or awareness, stigma attached to mental illness will continue to be a problem.

Scales
Attitudes Towards Mental Health Problems Scale (ATMHPS); BMI; Depression Anxiety and Stress Scale (DASS)

Progress / Outcome
Ethics form still being completed.
Expect to find that there is a high level of stigma attached to mental illness and people in the Caribbean have very negative attitudes towards mental illness.

Charlie Heriot-Maitland (charles.heriot-maitland@kcl.ac.uk)

Study title
Social-rank threat, dissociation, and psychotic-like experiences in an online sample

Description
This study is using an online questionnaire design to recruit a large sample from the general population, which will allow for well-powered cross-sectional analysis of relationships between dissociative traits, social-rank threat, and psychotic-like states. A follow-up at 6 months will create a longitudinal sub-sample, enabling tests of prediction and moderation over time.

Scales
Social Comparison Scale; Social Safeness and Pleasure Scale; Forms of Self-Criticising/Attacking and Self-reassuring Scale; Other as Shamer Scale; Self-Compassion Scale; Dissociative Experiences Scale; Transpersonal Experiences Scale

Progress / Outcome
Identifying predictive and protective factors for the course and outcome of psychotic-like experience in the general population can inform the approach of clinical services.
Name / Contact
Charlie Heriot (charles.heriot-maitland@kcl.ac.uk)

Study title
Social context of anomalous experiences in daily life

Description
This study is investigating the interplay of different threat experiences and processes in psychosis. Social-rank threat is being measured in both clinical and non-clinical groups to examine its role in relation to daily-life situations and psychotic-like states. This study is also investigating whether internal social safeness experiences may play a protective role in buffering or regulating dissociative processes and reducing psychotic-like states. ESM is being used to test a number of hypothesised relationships stemming from the dissociation and social-rank threat interaction model.

Scales
Social Comparison Scale; Social Safeness and Pleasure Scale; Psychosis Attachment Measure; Internalized Stigma of Mental Illness; Positive and Negative Syndrome Scale – Positive; Dissociative Experiences Scales

Progress / Outcome
May help to improve understandings of how social-rank threat and social safeness influence dissociative processes, psychotic-like experiences, and their outcomes.

Study title
Elderly bereaved people with prolonged grief reactions: A comparison of mindfulness training and compassion focused therapy

Progress / Outcome
We have this plan:
Nov 2015: finish first version of CFT protocol; Dec 2015: screening of participants for 2 groups – 1 mindfulness and 1 CFT; Jan-Feb 2016: running the 2 groups; May-Jun 2016: adjust the protocol; Aug 2016: PhD project or post doc going on; Primo 2017: main project going on; in 2020 we hope to have a clinic with best practice.
We are in the writing process with the protocol for CFT. The protocol for mindfulness training has been tested on the group with significant reduction of symptoms. We have a lot of data on the group (characteristic, symptoms, attachment styles, risks and so on) but not about treatment.

Study title
Compassion for others, self-compassion, quality of life and mental well-being measures and their association with compassion fatigue and burnout in student midwives: A quantitative survey

Description
Sample: 103 student midwives

Scales
Professional Quality of Life Scale; Self-Compassion Scale; Short Warwick and Edinburgh Mental Well-being Scale; Compassion For Others Scale.

Progress / Outcome
Just over half of the sample reported above average scores for burnout. The results indicate that student midwives who report higher scores on the self-judgement sub-scale are less compassionate towards both themselves and others, have reduced well-being, and report greater burnout and compassion fatigue. Student midwives who report high on measures of self-compassion and well-being report less compassion fatigue and burnout. Conclusion: student midwives may find benefit from ‘being kinder to self’ in times of suffering, which could potentially help them to prepare for the emotional demands of practice and study. Implications: developing, creating and cultivating environments that foster compassionate care for self and others may play a significant role in helping midwives face the rigours of education and clinical practice during their degree programme.

Study title
Does Compassion-Focused Therapy Training for Health Care Educators and Providers Increase Self-Compassion and Reduce Self-Persecution and Self-Criticism?

Description
28 participants classified into three groups: “nurses and midwives”, “counsellors/psychotherapists” and “other health care providers”
Scales
Self-Compassion Scale; Functions of Self-Criticizing and Self-Attacking Scale before and after CFT training.

Progress / Outcome
Results reveal an overall statistically significant increase in self-compassion and statistically significant reduction in self-critical judgment after training. There was no statistically significant reduction in self-persecution or self-correction scores after training.
Discussion: Developing self-compassion and compassionately responding to our own “self-critic” may lead the way forward in the development of more compassionate care among health care professionals. Training people in compassion-based exercises may bring changes in levels of self-compassion and self-critical judgment. The findings are exciting in that they suggest the potential benefits of training health care providers and educators in compassion-focused practices.

Name / Contact
Elaine Beaumont (E.A.Beaumont@salford.ac.uk) School of Nursing, Midwifery, Social Work & Social Sciences, University of Salford

Description
This article considers how compassionate mind training may be used to help student healthcare practitioners, including counsellors, nurses and midwives, cultivate self-compassion, which may help them face the demands of clinical care.

Progress / Outcome
Introducing CMT to healthcare students may help educate them regarding the deleterious impact of self-criticism. It may also help students to balance their affect regulation systems and cultivate compassion for their own suffering.
An education programme is proposed based on Paul Gilbert’s CMT model which may help students build resilience and could potentially provide a defensive barrier against empathic distress fatigue, burnout and compassion fatigue.

Study title
Experience and understanding of compassion and professional quality of life in mental health professionals

Description
The study aims to explore the lived experience and understanding of the receipt of compassion (self-compassion and compassion from others) and professional quality of life for mental health professionals working on two Older People’s Acute Mental Health wards. The research will be a piece of action research, to gauge and encourage participant enquiry into compassion as an aspect of self-care and how the acceptance and fear of compassion impacts on their quality of life.

Scales
The research has two parts: 1) A questionnaire containing four measures: Self-compassion Scale (Neff, 2003), Fear of Self-Compassion, Fear of Receipt of Compassion (Gilbert et al, 2011) and Professional Quality of Life (ProQuOL) (Stamm, 2009); and 2) Up to six IPA interviews exploring individual understanding of compassion for self, compassion from others and professional quality of life.

**Progress / Outcome**
The study is in the process of gaining university ethical approval and HRA approval.

Study title
Cognitions as mediators in the relationship between self-compassion and affect

Description
Two studies examined the mediating role of cognitions in the relationship between self-compassion and anxiety, depression, and life satisfaction when controlling for self-esteem in Japanese people.

Scales
The SCS-J; State-Trait Anxiety Inventory-Trait Form; Beck Depression Inventory; the Depression Anxiety Cognition Scale, the Rosenberg Self-Esteem Scale, the Satisfaction with Life Scale, the Positive Automatic Thought Scale

Progress / Outcome
Results suggested that both self-compassion and self-esteem increased positive automatic thoughts and decreased trait anxiety, whereas only self-esteem increased life satisfaction and decreased depression directly. Positive automatic thoughts increased life satisfaction and decreased depression and trait anxiety, and positive automatic thoughts mediated the relationship between self-compassion and negative affect.

Study title
Effects of compassionate thinking on negative emotions

Description
The present study compared the effect of compassionate thinking with other methods traditionally used in cognitive behavioural therapy (cognitive reappraisal, responsibility reattribution, and self-deflection).

Scales
The Multiple Mood Scale; SCS-J.

Progress / Outcome
The results revealed that participants who engaged in compassionate thinking and cognitive reappraisal reported significantly lower levels of negative emotions compared to those in the responsibility reattribution and control conditions. Furthermore, results of hierarchical regression analyses suggested that habitual use of self-compassion reduced negative emotions in all conditions.

Study title
Investigating Interoceptive awareness amongst adults attending a trans-diagnostic Compassion Focused Therapy group intervention.

Description
Interoceptive awareness is a term used to describe how we notice and pay attention to sensations in our bodies, as well as how we use information about sensations in our bodies to understand our emotional state and needs. Research has shown that interoceptive awareness plays an important role in regulating our affect, as well as in experiencing empathy.

In CFT, developing a more soothing, calm affect is a key focus, as is the development of different facets of compassion, including empathy. Given the role that interoceptive awareness plays in regulating affect and given its link with empathy, it may be that Compassion Focused Therapy works to relieve feelings of distress and shame partly by increasing interoceptive awareness – however, currently this has yet to be explored.

The purpose of this study is to investigate whether interoceptive awareness changes as a result of engaging in Compassion Focused Therapy, and whether interoceptive awareness is related to a reduction in psychological distress, an increase in compassion, or other key variables relating to Compassion Focused Therapy such as sense of social safeness and pleasure, or type of positive affect. Findings from this study will help us to better understand whether developing interoceptive awareness plays an important role in helping people to develop their capacity to regulate their emotions and to access a feeling of soothing and calm.

Scales
The Brief Symptom Inventory (BSI; Derogatis & Fitzpatrick, 2004); The Multidimensional Assessment of Interoceptive Awareness (Mehling et al, 2012); The Compassionate Engagement and Action Scales (Gilbert, 2015); The Types of Positive Affect Scale (Gilbert et al, 2008); The Social Safeness and Pleasure scale (Gilbert et al., 2009).

Progress / Outcome
Ethical approval has been granted, and data collection is currently underway. A systematic literature review will be conducted in the coming months.

Targeting Depression in the LGBT Population: A Mindful Self-Compassion Intervention

Description
This project seeks to reduce mental health problems in sexual minority populations throughout Australia. It will develop and evaluate a mindfulness-based self-compassion intervention to treat depression in lesbian, gay, and bisexual (LGB) Australians, which is a high-risk and under-served population. Aim is to reduce depression and internalized shame and sexual stigma of Lesbian, Gay and Bisexual young individuals via a self-compassion intervention.

Scales
Beck Depression Inventory; Internalized-Homophobia Scale; Self-Compassion Scale; Shame Proneness Scale; Fear of Compassion Scale; Suicide-Behaviour Questionnaire

Progress / Outcome
The study commenced in early 2016 and is currently underway.
It is hypothesised that the intervention will reduce depression, shame, and internalized homophobia in Lesbian, Gay and Bisexual individuals.

Charlie Heriot-Maitland (charles.heriot-maitland@kcl.ac.uk)

Study title
A case series study of Compassion Focused Therapy for distressing experiences (in psychosis)

Description
This study aims to develop a therapy protocol for individual CFT for psychosis (CFTp), and to test the feasibility of delivering and evaluating this intervention for people referred to community psychosis services. The initial protocol draft has been developed by CFT experts, psychosis experts, and experts by experience, but will continue to be developed and evolve as the study progresses, and as more is learnt (e.g. from the service-user participants) about applying the model in this population.

Scales
Social Comparison Scale; Social Safeness and Pleasure Scale; Forms of Self-Criticising/Attacking and Self-reassuring Scale; Other as Shamer Scale; Self Compassion Scale; Personal Beliefs about Illness Questionnaire; Psychotic Symptom Rating Scales; Depression, Anxiety and Stress Scale; Heart Rate Variability
Progress / Outcome
The aim, by the end of the study, is to have a final CFTp protocol that can be taken forward for use in an efficacy trial (RCT). This study will also aim to address a number of feasibility questions to inform the parameters of this future trial.

Description
Outcome study looking at impact of 8 Week Compassionate Mind Training course for the general public.

Scales
A range of measures (E.g. compassion, self-criticism, wellbeing).

Progress / Outcome
Results being collected.

Study title
An Evaluation of a Compassion Focused Therapy Group Programme Designed for Individuals with High Self-Criticism and Shame

Description
The aim of the study was to compare a new transdiagnostic CFT group with treatment as usual (TAU) in a psychiatric hospital in the Republic of Ireland. The study used a non-randomised controlled trial design.

Scales
The Brief Symptom Inventory (BSI) (Derogatis, 1993); Forms of Self-Criticism and Self-Reassurance Scale (Gilbert, Clarke, Hampel, Miles, & Irons, 2004); The Functions of Self-criticism Scale (Gilbert, Clarke, Hempel, Miles & Irons, 2004); The Fear of Self Compassion subscale of the Fears of Compassion Scale (Gilbert, McEwan, Matos, & Rivis, 2011); The Social Comparison Scale (Allan & Gilbert, 1995); The Submissive Behaviour Scale (Allan & Gilbert, 1997); The Other as Shamer scale (Goss, Gilbert & Allan, 1994); The California Psychotherapy Alliance Scale – Group (CALPAS-G) (Gaston & Marmar, 1994); The Group Climate Questionnaire (MacKenzie & Livesley, 1986); The Social Safeness and Pleasure scale (Gilbert et al., 2009).

Progress / Outcome
Main findings:
There were reductions in psychopathology as measured by the Global Severity Index of the Brief Symptom Inventory (Derogatis, 1993). There was a large effect size when comparing pre- and post- intervention scores for the CFT group $t(57) = 4.28$, $p < .001$, partial $\eta^2$ of .24.
There was a medium effect size when comparing post scores for the CFT group and the WL control. \( F(2, 84)=6.84, p<.05, \) partial \( \eta^2 \) of .08. These gains were maintained at the 2nd monthly session.

Multiple regression was used to investigate predictors of improvement in psychopathology following CFT. Change scores from the following scales were entered into the regression: Fear of Self Compassion subscale of the Fears of Compassion Scale (Gilbert, McEwan, Matos & Rivis, 2011); Other as Shamer Scale (Goss, Gilbert & Allan, 1994); The Social Safeness and Pleasure Scale (Gilbert, McEwan, Mitra, Richter, Franks, Mills, Bellew & Gale, 2009); The Functions of Self-Criticism Scale: both self-correction and self-persecution subscales (Gilbert, Clarke, Hempel, Miles & Irons, 2004). The model explained 34% of the variance in improved mental health as measured by the GSI of the BSI, \( R^2 = .40 \) (adjusted \( R^2 = .34 \)).
Online 8 session CMT course for young adults.

**Progress / Outcome**

Data collection.

**Study title**

‘Being kinder to myself’: A prospective comparative study, exploring post-trauma therapy outcome measures, for two groups of clients, receiving either Cognitive Behaviour Therapy or Cognitive Behaviour Therapy and Compassionate Mind Training

**Description**

Pre and Post comparative study. 16 Participants in a CBT only group and 16 in a combined CBT/CMT group following a traumatic incident

**Scales**

IES; HADS; SCS-SF

**Progress / Outcome**

Results supported two of the three original hypotheses. Participants in both conditions experienced a highly statistically significant reduction in symptoms of anxiety, depression, avoidant behaviour, intrusive thoughts and hyper-arousal symptoms post-therapy. Participants in the combined CBT and CMT condition developed statistically significant higher self-compassion scores post-therapy than the CBT-only group \[F(1,30)=4.657, p≤.05\]. There was no significant difference between treatment groups. The results suggest that CMT may be a useful addition to CBT for clients suffering with trauma-related symptoms.

**Study title**

Using Compassionate Mind Training as a Resource in EMDR: A Case Study

**Description**

This case study examines the contribution of compassionate mind training (CMT) when used as a resource in the eye movement desensitization and reprocessing (EMDR) treatment of a 58-year-old man, who presented after a recent trauma with psychological distress and somatic symptoms—an inability to sign his name. Self-report questionnaires were administered at pre-therapy, mid-therapy, post-therapy, and 9-month follow-up.

**Scales**

Hospital Anxiety and Depression Scale [HADS]; Impact of Events Scale-R [IES-R]; Self-Compassion Scale [SCS].
Progress / Outcome
EMDR with CMT facilitated recall of forgotten memories about his sister’s traumatic death decades previously, with related emotions of shame and grief, creating insight into how these past events linked to his current signature-signing phobia. Eight sessions of therapy resulted in an elimination of the client’s signature-signing phobia and a reduction in trauma-related symptoms, elevation in mood, and increase in self-compassion. Effects were maintained at 9-month follow-up. The “Discussion” section highlights the value of working collaboratively with clients to best meet their individual needs.

Study title
A narrative review exploring the effectiveness of Compassion-Focused Therapy

Description
This narrative review summarises findings of research that has shown use of Compassion-Focused Therapy (CFT) to improve psychological outcomes in clinical populations. Twelve studies were identified which showed significant psychological improvements in clients with diagnosed trauma symptoms, brain injury, eating disorders, personality disorders, schizophrenia-spectrum disorder, chronic mental health problems and psychosis, both within groups and during one-to-one therapy.

Progress / Outcome
Within the context of the reviewed studies, CFT has shown itself to be an effective therapeutic intervention when combined with approaches such as Cognitive Behavioural Therapy (CBT).

Conclusion: The research design of the majority of the studies examined precluded determining the extent of individual contributions that CFT made towards client recovery. Further research that uses more rigorous approaches are required to evaluate more effectively the role CFT plays in clients’ therapeutic recovery.

Study title
Emotionally expressive writing for people with depression: A randomised controlled trial

Description
This study will explore the impact of guided compassionate mind letter writing and a writing control condition (standard expressive writing) on depressive symptomatology, self-criticism and self-compassion over time as indexed by a range of self-report questionnaire measures. The intention is that the research will be carried out with students at Derby and/or Staffordshire University who are accessing university counselling services for depression-related difficulties.

Scales
Measures (subject to change): 1) Centre for Epidemiological Studies — Depression Scale (CES-D; Radloff, 1977); 2). Researcher-developed self-report questions developed specifically for this study to measure state self-criticism/self-compassion.

Progress / Outcome
The study is currently at the research proposal stage and has not yet received ethical approval.

Study title
An Evaluation of Compassion Focussed Group Psychotherapy

Description
The research aims to evaluate an extended exploratory Compassion Focussed Therapy groupwork and the impact on the experience of self-criticism, usage of services and general wellbeing in a group of patients with a history of complex trauma and relational difficulties. This study will utilise a quasi – experimental non-randomised within subject controlled design for the evaluation of the efficacy of Compassion Focussed therapy and in addition a qualitative study will be used to explore the Service User experience of this treatment. Participants will be recruited from secondary care and tertiary care services to facilitate a comparison of the two interventions. One group will be offered a 12 week intervention and a 40 week intervention, whilst the other group will be offered a 12 week intervention and treatment as usual for 40 weeks.

Scales
Forms of Self-Criticising/Attacking & Self-Reassuring Scale; Social Comparison Scale (SCS); The “Other as Shamer” Scale; Submissive Behaviour Scale (SBS); Depression, Anxiety and Stress Scales (DASS-21); Fear of Compassion Scales; Clinical Outcomes in Routine Evaluation (CORE); Impact of Event Scale; The work and Social Adjustment Scale; Internal Shame Scale.

Progress / Outcome
Ethics form submitted.

Study title
Effect of Group Cognitive Behavioural Therapy with Compassion Training on Depression

Description
Combining CBT and Compassion works (1h x10 weeks), for people with depression (n=14) in Japanese community.

Scales
BDI-II; Self-acceptance; Self-compassion Scale
Progress / Outcome
BDI-II score changed from 23.78(10.2) to 13.61(7.65). Effect size (d) was 1.13.
Self-acceptance score changed from 15.46(6.22) to 18.69(4.69). Effect size (d) was 0.59.
SCS score changed from 60.23(15.48) to 67.30(15.02). Effect size (d) was 0.46.

Study title
The Effects of a Program to Enhance Self-Compassion in Japanese Individuals: A Randomized Controlled Pilot Study

Description
The present study examined the effects of an Enhancing Self-Compassion Program (ESP) among Japanese individuals in a randomized controlled study.

Scales
The SCS-J; The Multiple Mood Scale; The State-Trait Anxiety Inventory-Trait form; The Beck Depression Inventory.

Progress / Outcome
In the post-treatment and follow-up, ANOVAs revealed that the ESP group (N = 16) had significant improvements in each of the subscales of self-compassion (Cohen’s ds: .91–1.51) except for mindfulness, whereas the control group (N = 12) did not. Greater reductions in negative thoughts and emotions in the ESP group were also found. These gains remained at follow-up.
