London: Adam & Charles Black, 1968. ----------.
A forest garden is a garden modelled on the structure of young natural woodland, utilising plants of direct and indirect benefit to people – often edible plants. It may contain large trees, small trees, shrubs, herbaceous perennials, annuals, root crops and climbers, all planted in such a way as to maximise positive interactions and minimise negative interactions, with fertility maintained largely or wholly by the plants themselves. “Woodland” implies a denser, darker collection of trees, which is not the case in a forest garden, as you’ll see. Shrubs provide all year round colour, structure and interest in the garden and can support a rich and varied wildlife. Find out more. Some shrubs should regularly be cut back to ground level - this can simulate a woodland glade and attract different species for a while. Possible visitors: Insects. Froghopper. Green shield bug. Honey bee. Hummingbird hawk moth. View history. "Common Knowledge. You must log in to edit Common Knowledge data. For more help see the Common Knowledge help page. Series (with order).
